

Five minutes, one decision

SITE DEMONSTRATION PLAN | Final deck or recording format: pending instructor guidance

Purpose

Demonstrate how an Arizona tourism planner can use the site to screen seasonal side-trip pilots from Sedona. The objective is to connect evidence to choices while making the limits visible. This PDF is a rehearsal plan, not the final presentation format.

[Open Beyond Sedona](#)

Before starting

Open the site on a laptop, close unrelated tabs, and confirm the charts load. Begin with the heatmap set to 2025, All experiences, and % of each park's peak month. Keep the destination comparison at Cottonwood / September and the spending filter at All spending. Rehearse once with a five-minute timer.

0:00-0:45 | Frame the question

On screen: Homepage introduction

Say: "Which nearby destinations should Arizona consider for seasonal side-trip promotion from Sedona? This tool is for tourism planners choosing small, testable pilots in Cottonwood, Jerome and Camp Verde." Explain that six state parks provide comparable attraction-level evidence; they do not measure all visitors to these towns.

0:45-1:45 | Show the seasonal evidence

On screen: Heatmap and annual-change chart

Click Explore the evidence. Switch the heatmap Display to Reported park visits, then back to % of each park's peak month. Briefly select 2024 and return to 2025. Explain that the colors compare a park with its own peak, not its carrying capacity. Scroll to the annual-change chart: visits across the five comparable full-year parks fell 7.6%. The original "sudden surge" premise is not established by these data.

1:45-2:45 | Test a place and a month

On screen: Destination comparison

Select Cottonwood / Dead Horse Ranch and Sep. Point to 11,705 visits, about 51% of that park's own 2025 peak. Change Destination to Jerome and Month to Jul. Describe the contrast: Jerome received 16.5% of annual visits in June-August, versus 34.9% at Slide Rock. Different timing supports a test, but museum demand and local capacity still need verification.

From evidence to a pilot

DEMONSTRATION PLAN | Second half

2:45-3:45 | Add spending and resident context

On screen: Economic and resident sections

Change Category from All spending to Lodging and back. Dead Horse Ranch is associated with \$18.444 million of direct non-local visitor spending within 50 miles in 2025. Explain that this is not Cottonwood-only revenue or a campaign forecast; park spending areas overlap. Show Sedona's resident responses: 49% favor a smaller tourism role, 45% the same, and 6% more. These responses do not establish support in receiving towns.

[Open this part of the site](#)

3:45-4:35 | Make a conditional recommendation

On screen: The shortlist

Propose a September Cottonwood nature-and-town pilot, a modest summer museum test in Jerome, and a smaller Fort Verde history itinerary outside its October peak. Keep Rockin' River Ranch conditional because opening history and restricted operating days complicate the comparison. Before promotion, verify access, staffing, environmental conditions and receiving-community support.

[Open this part of the site](#)

4:35-5:00 | Close with the next evidence

On screen: Sources and Google Drive link

Conclude: "The site can help choose what to test. It cannot prove spare capacity, additional spending, or less congestion in Sedona." Open Sources & methodology to show provenance, then point to Google Drive files for the separate submission materials. A pilot must measure whether a side trip replaces time in Sedona or simply extends the trip.

If the live site is unavailable

Use the dataset and methodology PDFs to explain the same sequence. Do not claim to have demonstrated working controls. After class, adapt this plan to the confirmed deck or recording requirement.
